

## SOLIScript® 1-step Multiplex Probe Kit (ROX)

Catalogue Number	Pack Size
08-59-0000S	50 x 20 µl reactions
08-59-00250	250 x 20 µl reactions

### Shipping:

At room temperature

### Batch Number and Expiry Date:

See vial

### Storage and Stability:

- Routine storage at -20°C until expiry date
- Can be stored at +4°C for up to 6 months
- Stability at room temperature (15–25°C) for 1 month
- Freeze-thaw stability: 30 cycles
- Store 5x One-step Multiplex Probe Mix (ROX) protected from light

Stability at room  
temperature  
**1 MONTH**

Store at -20°C

### Reaction setup:

At room temperature

Manufactured by Solis BioDyne, in compliance with the ISO 9001 and ISO 13485 certified Quality Management System.

DS-08-59 v2

1/8

### Content:

Component	Catalogue Number	
	08-55-0000S 50 x 20 µl rxn	08-55-00250 250 x 20 µl rxn
<b>40x One-step SOLIScript® Mix</b>	25 µl	125 µl
<b>5x One-step Multiplex Probe Mix (ROX)</b>	200 µl	1000 µl
<b>Water, nuclease-free</b>	1.25 ml	5.0 ml

Note: To avoid repeated freezing and thawing as well as to minimize the contamination risk of stock solutions of reagents, it is highly recommended to divide large-volume stocks into several smaller aliquots and store them at -20°C.

### Mix compositions:

Kit component	Description
<b>40x One-step SOLIScript® Mix</b>	SOLIScript® Reverse Transcriptase, RiboGrip™ RNase Inhibitor
<b>5x One-step Multiplex Probe Mix (ROX)</b>	HOT FIREPol® DNA polymerase, dNTPs (including dUTPs), passive reference dye based on ROX dye, 15 mM MgCl <sub>2</sub> (1x RT-qPCR solution – 3 mM MgCl <sub>2</sub> )

Note: Heat-inactivated UNG is not included in the Kit and should be purchased separately from other supplier.

### Compatible real-time instruments:

qPCR cyclers where ROX is used as a passive reference dye for normalization of fluorescent signal.

### Product description:

- SOLIScript® 1-step Multiplex Probe Kit (ROX) is optimized for sensitive and accurate quantification of RNA targets by real-time one-step RT-PCR (RT-qPCR) using dual-labeled hydrolysis probes (e.g. TaqMan® probes), and is suitable for detection and quantification of up to four targets simultaneously.
- The Kit comes in 3 tubes (including water) and contains all the components necessary (except RNA template, probe(s), and primers) to perform RT-qPCR in a single tube on qPCR cyclers that require an internal reference dye ROX for normalization of fluorescent signal.
- 40x One-step SOLIScript® Mix comprises *in silico*-engineered SOLIScript® Reverse Transcriptase and RiboGrip™ RNase Inhibitor. SOLIScript® is a thermostable reverse transcriptase active at temperatures up to 60°C, beneficial when using templates with high levels of secondary structure. RiboGrip™ inactivates RNase A to protect RNA sample from degradation and increase cDNA yield in reactions with low RNA amounts.
- 5x One-step Multiplex Probe Mix (ROX) contains HOT FIREPol® DNA Polymerase in a unique reaction buffer that maximizes the performance of the Kit with high GC-content regions. The buffer includes dUTPs to prevent carry-over contamination from previous amplifications if used in combination with heat-inactivated uracil-N-glycosylase (UNG).
- The Kit can be used for gene expression analysis and low-copy gene detection, gene knockdown validation, miRNA profiling and quantification, characterization of GMOs, RNA viral pathogen detection and quantification.

2/8

### Step-by-step guidelines:

1. Thaw the reagents at room temperature. Mix each reagent by gentle vortexing or pipetting up and down, then centrifuge briefly. **NOTE:** Minimize the exposure of the 5x One-step Multiplex Probe Mix (ROX) and fluorescent probe(s) to light.
2. Prepare a reaction mix. Add all components except the template RNA. **NOTE:** Include no-template (NTC) and no-RT (NRT) controls. In NTC replace RNA, in NRT replace 40x One-step SOLIScript® Mix with corresponding amounts of nuclease-free water. If combining different assays on a single plate, include at least one NRT for each assay for every RNA.

Component	Volume <sup>1</sup>	Final conc.
40x One-step SOLIScript® Mix	0.5 µl	1x
5x One-step Multiplex Probe Mix (ROX)	4 µl	1x
Forward Primer (10 µM) <sup>2</sup>	0.8 µl	400 nM
Reverse Primer (10 µM) <sup>2</sup>	0.8 µl	400 nM
Probe <sup>2</sup>	Variable	250 nM
Template RNA <sup>2</sup>	Variable	1 pg–1 µg (total RNA)
Water, nuclease-free	up to 20 µl	
<b>Total reaction volume</b>	<b>20 µl</b>	

<sup>1</sup> Reaction volume can be scaled from 10 to 50 µl. Scale components proportionally according to sample number and reaction volumes. Use enough of each reagent for your reactions, plus 5–10% extra volume to accommodate pipetting errors.

<sup>2</sup> See page 6–7 for Recommendations on primers/probe design, template preparation and additional guidelines.

- Mix the reaction mix thoroughly, then centrifuge briefly. Dispense appropriate volumes of mix into PCR wells.
- Add template RNA to the PCR wells. Seal the wells using the procedure recommended for the cycling instrument being used, and centrifuge the reactions briefly.
- Run your RT-qPCR assay as shown in table below. **NOTE:** When programming your RT-qPCR run, choose the detection channel(s) of the qPCR instrument that correspond to the fluorophore label(s) of the target-specific probe(s) present in the assay. Acquisition of real-time data generated by fluorogenic probe(s) should be performed as recommended by the instrument's manufacturer.

		Temperature	Time
Reverse transcription <sup>1</sup>		50°C	15 min
Enzyme activation <sup>2</sup>		95°C	10 min
40 cycles	Denaturation	95°C	15 sec
	Annealing/Extension	60°C	60 sec

<sup>1</sup> A 50°C RT step temperature is optimal for SOLIScript® Reverse Transcriptase. SOLIScript® Reverse Transcriptase is active at 45–60°C. For difficult templates with high secondary structure, the temperature may be increased to 60°C.

<sup>2</sup> IMPORTANT: Enzyme activation step at 95°C for 10 min is crucial for full activation of DNA polymerase and inactivation of reverse transcriptase.

- Collect and analyze the data according to the instrument-specific instructions. Verify the amplification curve, set up a standard curve if absolute quantification is desired.

5/8

- Suitable primers are typically 18–24 bp long, with GC-content 35–65 %, and target a 50–150 bp amplicon. The optimal melting temperature ( $T_m$ ) of the primers is 58–60°C. Primers with  $T_m$  outside of this range may and/or amplicons longer than 150 bp require optimization of cycling conditions. For multiplex reactions, design primer pairs with similar annealing temperatures for all targets to be amplified. Self-complementarity of primers should be avoided.
- Optimal results may require titration of primer concentration between 200 and 600 nM. A final concentration of 400 nM each primer is suitable for most applications.

#### Probe:

- Fluorescent reporter dye(s) and quencher(s) for your RT-qPCR analysis should be chosen according to the detection capabilities of your qPCR platform. Refer to your instrument manufacturer's guidelines for information specific to your particular instrument.
- The length of the probe is 9–40 bases (hydrolysis probes: up to 30 bases). The probe binding site should be in close proximity to the forward or reverse primer; however, binding sites should not overlap. Probe can bind to either strand of the target.
- $T_m$  of the probe should be 6–8°C higher than the  $T_m$  of the primers. In case the  $T_m$  of the probe is not optimal, less of the probe is bound to the target sequence. This may result in compromised sensitivity, reduced fluorescence signal and not a true representation of the target amount in the sample.
- Optimal results may require titration of probe concentration between 100 and 250 nM. A final concentration of each 250 nM probe is suitable for most applications.

7/8

## Recommendations for a successful RT-qPCR experiment

#### Template:

- Ratios of the absorbance at 230, 260, and 280 nm are used to assess the purity of nucleic acid samples. "Good RNA" has 260/280 and 260/230 ratios equal or higher than 1.8 and 2.0, respectively. The presence of contaminants such as phenol, carbohydrates or EDTA may compromise the results.
- Treat your purified RNA sample with RNase-free DNase I to remove contaminating genomic DNA which can act as template during reaction.
- Starting material can range from 1 pg to 1 µg of purified total RNA per 20 µl reaction. To determine the optimal template quantity (especially when amplifying more than one target and/or using other types of input RNA, e.g. mRNA or viral RNA), perform your reactions on a serially diluted template (e.g. 10-fold dilution series). Select the quantity that produces the earliest Ct without inhibiting your amplification.

#### Primers:

- Use dedicated software, such as open source Primer3 and NCBI Primer-BLAST to design target-specific primers. To prevent amplification from genomic DNA, design primers spanning exon-exon junctions of the target mRNA, or primers that hybridize with sequences in consecutive exons flanking a long (e.g. 1 kb) intron. Amplification of more than one target in a single reaction may require considerable optimization, individual assays must be validated prior to multiplexing.

6/8

#### Safety precautions:

Please refer to Safety Data Sheet for more information.
